#### THE LIVER

# Liver

Your liver is your body's largest internal organ. It is also the busiest! It performs hundreds of different tasks. It makes bile to aid the breakdown of food (see page 75). It controls the amount of sugar in your blood, stores vitamins and minerals, and gets rid of old blood cells. Together with your kidneys, it works to get rid of toxins and body waste. As the liver carries out all these activities, it produces a lot of heat. This is distributed around your body to help keep you warm.

## **ANSWER THESE QUESTIONS**

The Liver is the largest internal organ

TRUE

**FALSE** 

The Liver controls the amount of sugar

TRUE

**FALSE** 

Liver gets rid of old blood cells

TRUE

**FALSE** 

It produces a lot of heat

TRUE

**FALSE**
