Photosynthesis and How Plants Grow

Harold likes to read gardening books. One of the most important chemical reaction in plants in photosynthesis. It is how we get oxygen to breathe.

1. Green plants absorb the carbon dioxide that we breathe out.
2. They use sunlight and water to convert the carbon dioxide into oxygen and sugars.
3. We breathe in the clean oxygen.
4. The plant uses the sugars plus water to grow.

ACSSU002 / STe-3LW-ST - Recognise that living things have basic needs including air, food and water.
