

CELL STRUCTURE

1. Write the type of cell and complete the parts of the cell

2. Match the name of each part with their function.

Nucleus	Cell membrane	Cytoplasm	Vacuoles	Cell wall	Chloroplasts
---------	---------------	-----------	----------	-----------	--------------

- Jelly-like substance that fills the cell and where we can find all the organelles of the cell.

- It protects the cell and gives shape.

- It controls all the functions of the cell. It's the brain of the cell.

- They contain chlorophyll which is needed for photosynthesis.

- They contain water and minerals.

- Thin layer that surrounds the cell. It controls the substances that enter and leave the cell.

SPECIALISED CELLS

1. Match the specialised cells with their function

Red blood cells	Absorb water and minerals
White blood cells	Protect our bodies from bacteria
Nerve cells	Carry oxygen
Root hair cells	Absorb sunlight
Leaf cells	Carry information from the brain to the rest of the body

2.
