Can batman fly?

Scientists have finally answered one of life's (1)____ – whether Batman can really fly. Researchers from Leicester University in the U.K. conducted tests (2)____ the type of cape Batman wears as he flies around Gotham City watching for mischief and criminals. They concluded that he would be able to glide (3)____ well, but would crash at high speed and die once he tried to (4)____. The researchers say this is because the wingspan of his cape is too short to allow him to land smoothly. Researcher and superhero (5)____ David Marshall said: "If Batman wanted to survive the (6)____, he would definitely need a bigger cape. Or if he preferred to keep his style intact he could opt for...jets to keep himself aloft."

The research paper is called 'Trajectory of a Falling Batman'. The research team tested the physics (7)_____ the cape worn in the 2005 movie "Batman Begins". The wingspan of the cape is 4.7 metres, which is around half (8)_____ needed for a human to land safely. The research team said that if Batman jumped from a building about 150 metres high, he would be able to glide for about 350 metres. The problem would (9)_____ when he attempted to land. The (10)_____ would be the equivalent of being hit by a car driving at 80kph. The team concluded that: "Clearly gliding using a batcape is not a safe way to travel, (11)_____ a method to (12)_____ slow down is used such as a parachute."
