Cell Structures

Join the part of the cell that corresponds to each function described

part of the cell	function described
 Nucleus نواة	produces ribosomes inside the nucleus
 Ribosome رايبوسوم	converts fuel particles (sugars) into useable energy
 Nucleolus نوية	directs cell processes; contains the cell's DNA; stores information for cell growth, function, and reproduction
 mitochondrion ميتوكندريون	helps manufacture proteins
 Centrioles Centriole مريكزان	modifies, sorts, and packages proteins for transport outside the cell
 Golgi apparatus جهاز جولجي	structure near the nucleus that functions during cell division
