

Fresh and salty water: Match the definitions to the pictures:

Ocean and Seas

The ocean is a large body of salt water. Seas are smaller areas of the ocean that are partly surrounded by land.

Glaciers and Ice Caps

A **glacier** is a large body of slowly moving ice. Glaciers form when more snow falls than melts in an area. The polar **ice caps** are large areas of ice at the North and South Poles.

Rivers

A river is flowing fresh water. Water in rivers moves downhill. Rivers flow into the ocean, lakes, and other rivers.

Lakes and Ponds

Land surrounds lakes and ponds, which are smaller than the ocean. Lakes are generally larger than ponds. Almost all lakes and ponds contain fresh water, but a few lakes and ponds contain salt water.
