

Read the text and say True or False.

For years, many people have thought that video games make you feel lonely and gain weight, but new researches are finding that games can really change your body and your mind for the better.

Researches have shown that pre-school children who play interactive games get better skills, for example they can kick, catch and throw a ball better than children who don't play video games. These children are faster and make fewer mistakes than those who don't.

Games are also good for the brain. Gamers can pay attention to more than six things at once without being confused. Gaming can, also, help solve brain problems. People who play games have time to relax and feel happy doing something they like. They feel more excited and more energetic.

1. The text is about the problems of video games.

True

False
