

Práctica de operaciones con fracciones

Para resolver escribí las fracciones equivalentes como muestra el ejemplo.

Ejemplo

$$\frac{\overset{1}{2}}{\underset{2}{2}} + \frac{\overset{1}{4}}{\underset{4}{4}} + \frac{\overset{1}{8}}{\underset{8}{8}} = \frac{\overset{4}{8}}{\underset{8}{8}} + \frac{\overset{2}{8}}{\underset{8}{8}} + \frac{\overset{1}{8}}{\underset{8}{8}} = \frac{\overset{7}{8}}{\underset{8}{8}}$$

$$\frac{2}{5} + \frac{3}{10} = \frac{\quad}{\quad} + \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{3}{8} + \frac{9}{16} = \frac{\quad}{\quad} + \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{4}{5} + \frac{7}{10} = \frac{\quad}{\quad} + \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{2}{9} + \frac{13}{18} = \frac{\quad}{\quad} + \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{1}{12} + \frac{5}{6} = \frac{\quad}{\quad} + \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{1}{6} + \frac{3}{5} + \frac{7}{10} = \frac{\quad}{\quad} + \frac{\quad}{\quad} + \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{3}{4} + \frac{3}{5} + \frac{1}{2} = \frac{\quad}{\quad} + \frac{\quad}{\quad} + \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{14}{9} + \frac{1}{3} + \frac{5}{6} = \underline{\hspace{1cm}} + \underline{\hspace{1cm}} + \underline{\hspace{1cm}} = \underline{\hspace{1cm}}$$

$$2 + \frac{2}{3} + \frac{5}{6} = \underline{\hspace{1cm}} + \underline{\hspace{1cm}} + \underline{\hspace{1cm}} = \underline{\hspace{1cm}}$$

$$3 - \frac{7}{6} = \underline{\hspace{1cm}} + \underline{\hspace{1cm}} = \underline{\hspace{1cm}}$$

$$\frac{3}{10} + \frac{1}{4} = \underline{\hspace{1cm}} + \underline{\hspace{1cm}} = \underline{\hspace{1cm}}$$

$$\frac{7}{8} - \frac{1}{12} = \underline{\hspace{1cm}} + \underline{\hspace{1cm}} = \underline{\hspace{1cm}}$$

$$\frac{3}{4} + \frac{5}{6} + \frac{1}{8} = \underline{\hspace{1cm}} + \underline{\hspace{1cm}} + \underline{\hspace{1cm}} = \underline{\hspace{1cm}}$$
