Answer true or false to the following questions.

Electrical injuries only cause damage to the outside of the body.	
You should not touch a person who is still in contact with the power source.	
You should check for breathing when the patient is still in contact with the power source.	
There is no need for a person to get medical attention after an electrical injury.	
Only give CPR if the patient needs it and the power source has been switched off.	
A high voltage current can be found in powerlines and overhead cables.
