Resep Masakan Ayam Pongok

Bahan:
 1 ekor ayam
 1 kg kentang
 1 kg kacang panjang
 1 kg bayam
 1 kg kacang merah
 1 kg kacang hijau
 1 kg kacang buncis
 1 kg kacang kedelai
 1 kg kacang mete
 1 kg kacang almond
 1 kg kacang pistachio
 1 kg kacang walnut
 1 kg kacang hazelnut
 1 kg kacang macadamia
 1 kg kacang cashew
 1 kg kacang pecan
 1 kg kacang brazil
 1 kg kacang pinus
 1 kg kacang ginkgo
 1 kg kacang chestnut
 1 kg kacang almond
 1 kg kacang pistachio
 1 kg kacang walnut
 1 kg kacang hazelnut
 1 kg kacang macadamia
 1 kg kacang cashew
 1 kg kacang pecan
 1 kg kacang brazil
 1 kg kacang pinus
 1 kg kacang ginkgo
 1 kg kacang chestnut

Langkah-langkah:
 1. Ayam dipanggang hingga matang.
 2. Ayam diiris-iris.
 3. Ayam disajikan dengan nasi putih.
 4. Ayam disajikan dengan sayur-mayur.
 5. Ayam disajikan dengan kacang-kacangan.

Nutrition in plants for only 10 min

Structure of a plant cell:

- Cell wall:** Made of cellulose, provides structural support.
- Chloroplasts:** Contain chlorophyll, the green pigment that captures light energy for photosynthesis.
- Central vacuole:** A large, fluid-filled space that maintains turgor pressure and stores nutrients.
- Cell membrane:** Controls the movement of substances in and out of the cell.
- Nucleus:** Contains the cell's genetic material (DNA).
- Other organelles:** Mitochondria (energy production), Golgi apparatus (protein transport), and cytoplasm (fluid medium for organelles).

Photosynthesis:

Overall equation:

$$6\text{CO}_2 + 6\text{H}_2\text{O} \xrightarrow{\text{Light energy}} \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$$

Light-dependent reactions:

- Occur in the thylakoid membranes of chloroplasts.
- Light energy is used to split water (H_2O) into hydrogen ions (H^+) and oxygen (O_2).
- Electrons from water are transferred to photosystem II and then to photosystem I, where they are used to reduce NADP $^+$ to NADPH.

Calvin cycle (C3 pathway):

- Occurs in the stroma of chloroplasts.
- Uses CO_2 and NADPH from the light-dependent reactions to produce glucose ($\text{C}_6\text{H}_{12}\text{O}_6$).
- Key steps include: CO_2 fixation, reduction, and regeneration of the C_3 acceptor.

Nutrient Distribution:

Macronutrients (20% of total):

- Carbon:** The most abundant element in plants, used for building organic molecules.
- Hydrogen:** Used in organic molecules and water.
- Oxygen:** Used in organic molecules and water.

Mineral Nutrients (18% of total):

- Primary nutrients:** Nitrogen (N), Phosphorus (P), and Potassium (K).
- Secondary nutrients:** Calcium (Ca), Magnesium (Mg), and Sulfur (S).
- Trace elements:** Iron (Fe), Manganese (Mn), Zinc (Zn), Copper (Cu), Boron (B), Molybdenum (Mo), and Nickel (Ni).

Nutrient Transport:

- Xylem:** Transports water and dissolved minerals from the roots to the leaves.
- Phloem:** Transports organic nutrients (sugars) from the leaves to other parts of the plant.

Summary:

Plants are autotrophic organisms that produce their own food through photosynthesis. They require light, CO_2 , and water to synthesize glucose, which is then used for energy and growth. Nutrients are absorbed from the soil and transported throughout the plant via the vascular system.

A screenshot of the Windows 8 Start screen. Callouts point to various elements: 'Personalize' points to the bottom-left icon; 'Choose network's features' points to the 'Network' tile; 'Click the button to open your settings' points to the 'Settings' tile; and 'If desired, use this option to see more' points to the 'More' button at the bottom.

ESPRESSO		BREWED	
FINE GRIND		PERMITS GRIND	
HIGH PRESSURE		USES GRAVITY	
QUICK CONTACT WITH WATER		LONGER CONTACT WITH WATER	

Pizza Quesadilla		
1		Melt butter on skillet
2		Cover with sauce and add pepperoni
3		Flip & cook on other side in skillet
4		Warm toppings
5	Cook until melted & Enjoy!
