

Raw sap	
Elaborated sap	
Oxygen	
Carbon dioxide	
Sunlight	
Stomata	
Roots	
Stem	

They absorb water and minerals from the soil.
This substance is composed by minerals and water.
It takes the raw sap to the leaves.
It is expelled in the transpiration.
They are small holes in the leaves, they take the carbon dioxide.
It contains the nutrients for the plant.
It is absorbed by a green chemical called chlorophyll.
It is in the air and it enters the leaves through the stomata.
