There exists a very interesting island in the Pacific Ocean. It's called Easter Island which is famous for its statues. Hundreds of these huge, stone faces can be found all over the island.

The question is who made them. How they move these giant pieces of rock? Studies show that people first arrived on the island about 1600 years ago. They had a very advanced culture. Many objects were made by them, and they had their own written language. However, the number of people on the island grew and grew until it reached about 10,000 people.

It happened so that there were too many people and there wasn't enough food to eat. A terrible war happened and many of the statues were destroyed. When western explorers discovered the island on Easter Day in 1722, the huge rock statues were the only sign of the existence of a great society once living there.
