

## The Five Senses

We live in a world full of colors, sensations, tastes, sounds and smells.

The human body has five senses that make our life a lot more interesting. They are hearing, touch, taste, smell and sight. Our body uses organs to do some of the work. These organs are our ears, skin, tongue, nose and eyes. When we use these organs, they talk to our **brain**. They may warn us by telling us something is too hot when touched. When we **touch** things, small hairs and sensors in our skin figure out what we feel. The sense of **hearing** uses tiny little hairs and bones in our ears to figure out sounds. We have around 10,000 taste buds on our tongue to help us **taste** food. The sense of **smell** uses hundreds of sensory cells in our nose. Our sense of **sight** uses over two million different tiny parts in our eyes to see! Most people use more than one sense to figure things out.

### Answer TRUE or FALSE

	1. The sense of hearing uses taste buds.
	2. The human body has five senses.
	3. Our sense of smell helps us see.
	4. Our organs talk to our heart.
	5. The sense of touch uses little tiny hairs.
	6. Senses may warn us when something is too hot.
