

Organ System Functions

Can you identify the function of each of the six organ systems?

Respiratory system	Muscles and bones working together to cause movement and support the body.
Digestive system	Produces sperm and eggs, and is where the foetus develops.
Reproductive system	Replaces oxygen and removes carbon dioxide from blood.
Circulatory system	Protects the body against infections.
Muscular system	Breaks down and then absorbs food molecules.
Immune system	Transports substances around the body.
