Name: _____

The Mighty Forces Around Us

Forces are like magic powers that make things move or stop. They are all around us, even though we can't see them. Imagine trying to push a heavy box. That's a force at work!

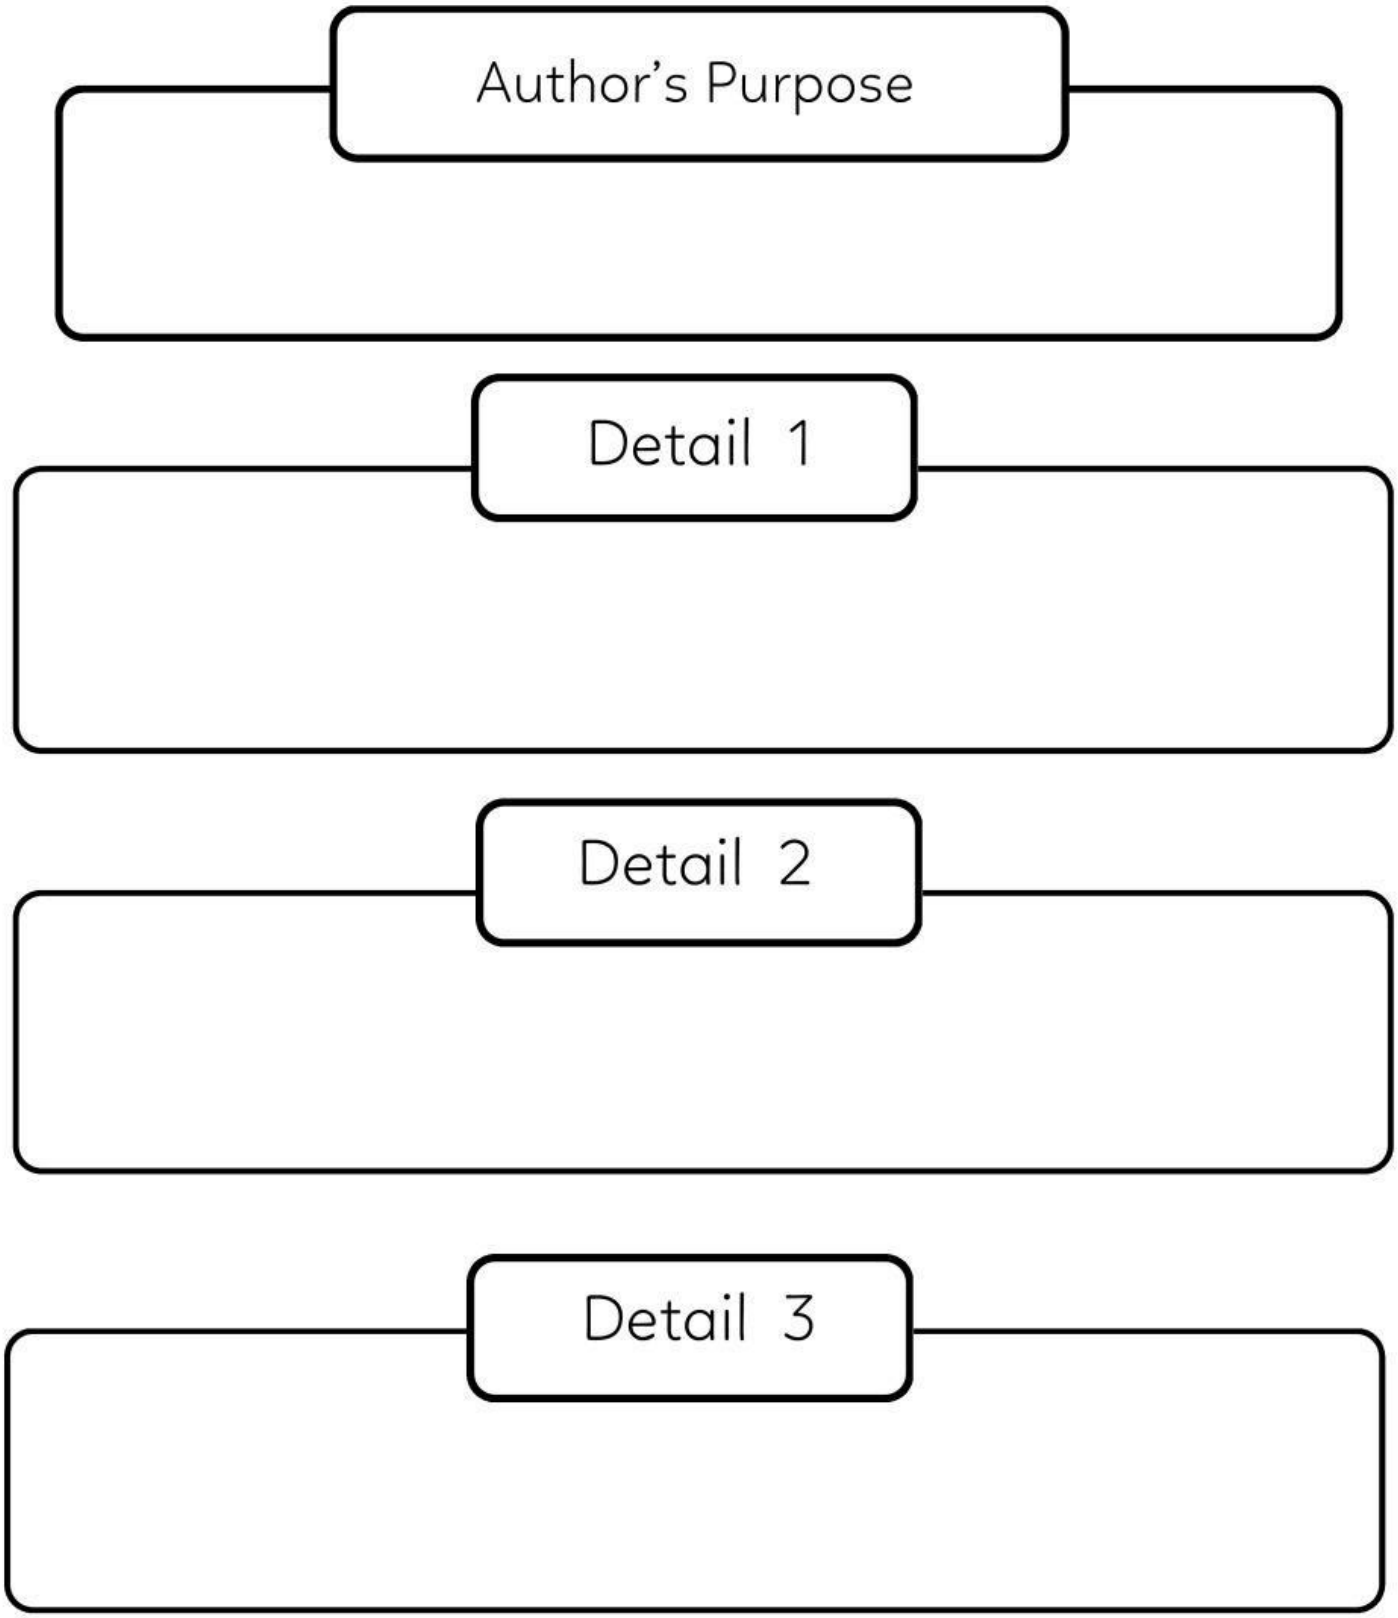

There are different types of forces. One is called gravity. It's what keeps us on the ground and makes things fall when we drop them. Another is friction. It's like a secret hand that slows things down when they slide.

Magnets have a special power called magnetism. They can pull things toward them, like magic! Air can be a force too. When you ride your bike and press the brakes, you're using air to slow down.

Forces are everywhere, from the wind blowing the leaves to you picking up your toys. They help us do all sorts of things!
