

Renewable and Nonrenewable Energy

Warm-Up: Below you will see pictures of 4 different energy sources (Wind, Solar and Hydroelectric).

Choose one of them to answer the questions below.

1. Which energy source did you choose?
2. How do you think this energy source is helpful for people?
3. Is it possible for us to use up all this energy source?

As you can see, some of the energy sources above can be used forever and will never run out, like wind and solar energy. These energy sources are called Renewable Energy. Other energy sources will eventually run out if we continue to use them, such as fossil fuels. These energy sources are called Nonrenewable Energy.
