

LAYERS OF THE RAINFOREST

1. Link each dot to its corresponding layer name
2. Mark the square with a tick if the description is accurate

Forest Floor

This layer is dark and humid, covered with a layer of decomposing plant and animal matter.

Canopy

This layer is characterized by small trees, shrubs, and herbaceous plants that thrive in the filtered sunlight that reaches the forest floor.

Emergent Layer

This layer consists of the tallest trees that rise above the general canopy, often reaching heights of 100 feet or more

Understory

This layer is formed by the crowns of mature trees, creating a continuous layer of leaves and branches.
