

Resuelva los siguientes ejercicios de factor común

$$(34 \times 45) - (124 \times 45) = \square \times (\square \square \square) =$$
$$\begin{array}{ccc} \square & \square & \square \\ \diagup & & \diagdown \\ \square & \square & \square \end{array} = \begin{array}{ccc} \square & \times & \square \\ & \square & \end{array}$$

$$(456 \times 145) + (124 \times 145) = \square \times (\square \square \square) =$$
$$\begin{array}{ccc} \square & \square & \square \\ \diagup & & \diagdown \\ \square & \square & \square \end{array} = \begin{array}{ccc} \square & \times & \square \\ & \square & \end{array}$$

$$(94 \times 48) - (224 \times 48) = \square \times (\square \square \square) =$$
$$\begin{array}{ccc} \square & \square & \square \\ \diagup & & \diagdown \\ \square & \square & \square \end{array} = \begin{array}{ccc} \square & \times & \square \\ & \square & \end{array}$$

$$(134 \times 25) + (24 \times 25) = \square \times (\square \square \square) =$$
$$\begin{array}{ccc} \square & \square & \square \\ \diagup & & \diagdown \\ \square & \square & \square \end{array} = \begin{array}{ccc} \square & \times & \square \\ & \square & \end{array}$$
