

# Operaciones con Fracciones

Calcula las siguientes operaciones hallando el M.C.M. para escribir fracciones equivalentes lo más simplificadas posibles

$$\frac{2}{6} + \frac{1}{4} = \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$$

$$\frac{7}{12} + \frac{1}{3} = \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$$

$$\frac{2}{3} - \frac{2}{9} = \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$$

$$\frac{5}{6} - \frac{1}{4} = \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$$

$$\frac{2}{9} + \frac{1}{6} = \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$$

$$\frac{3}{7} + \frac{5}{14} = \frac{\square}{\square} + \frac{\square}{\square} = \frac{\square}{\square}$$

$$\frac{8}{15} - \frac{1}{6} = \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$$

$$\frac{3}{4} - \frac{2}{12} = \frac{\square}{\square} - \frac{\square}{\square} = \frac{\square}{\square}$$

Simplifica las siguientes fracciones hasta conseguir una fracción irreducible

$$\frac{10}{30} = \frac{\square}{\square}$$

$$\frac{12}{14} = \frac{\square}{\square}$$

$$\frac{8}{12} = \frac{\square}{\square}$$

$$\frac{10}{15} = \frac{\square}{\square}$$

$$\frac{6}{9} = \frac{\square}{\square}$$
