

What do we do when antibiotics don't work any more?

Penicillin changed everything. Infections that had previously killed were suddenly quickly curable. Yet as Maryn McKenna shares in this sobering talk, we've squandered the advantages afforded us by that and later antibiotics. Drug-resistant bacteria mean we're entering a post-antibiotic world -- and it won't be pretty. There are, however, things we can do ... if we start right now.

Watch the video and complete the activities:

1. If you look back through history, most people died of:
cancer / heart disease / injuries and infection
2. We stand today on the threshold of the **pre-antibiotic / post-antibiotic** era
3. People are dying of infections because of **antibiotic shortage / antibiotic resistance**
4. Penicillin was distributed in 1943, and resistance appeared in **1944 / 1945**.
5. Vancomycin arrived in 1972, and vancomycin resistance in **1988 / 1990**.
6. Imipenem in 1985, and resistance to it in **1998 / 1989**
7. Daptomycin in 2003, and resistance to it in **2005 / 2004**.
8. In the United States and Europe **50,000 / 100,000** people a year die of infections which no drugs can help.
9. If we lost antibiotics, here's what else we'd lose:
First, any protection for people with weakened immune systems -- _____ patients, AIDS patients, transplant _____, premature babies.
Next, any treatment that installs foreign objects in the body: _____ for stroke, pumps for _____, dialysis, _____ replacements.
10. Next, we'd probably lose _____.
11. If we can't control this by 2050, the worldwide toll will be **8/10** million deaths a year.
12. Complete the quote by Alexander Fleming:

"The thoughtless person _____ with penicillin treatment is morally responsible for the _____ of a man who succumbs to _____ with a penicillin-resistant organism." He added, "I hope this _____ can be averted."
