A placebo is a **sham** or **simulated** medical intervention. Sometimes patients given a placebo treatment will have a perceived or actual improvement in a medical condition, a phenomenon commonly called the placebo effect.

A study of Danish general practitioners found that 48% had prescribed a placebo at least 10 times in the past year. The most frequently prescribed placebos were **antibiotics** for viral infections and vitamins for fatigue. Specialists and hospital-based **physicians** reported much lower rates of placebo use.

- 1. The placebo effect refers to
- A. a simulated medical treatment.
- **B.** an improvement in a patient's health as a result of a simulated medical treatment.
- C. a common medical phenomenon.
- 2. According to a study, placebos were prescribed in Denmark
- A. mainly by doctors working in hospitals.
- B. instead of antibiotics.
- C. for fatigued patients or those suffering from viruses.
