BE CAREFUL ABOUT WHAT YOU POST

When it first launched, social media was a fun platform to share photos, jokes, and thoughts. There was a belief that what you posted on your online profiles or timelines was only distributed to friends, family, and those contacts with whom you chose to share. Today, however, due to development of technology, what you post online can have serious and lasting consequences. To prevent something bad happens in the future, you should be careful about what you post.

Nothing is private on social media. It is important to know that everything you post, share, comment on, and promote online can easily be made available to the public. How can it happen? We can take a screenshot of your social media post or image, and we can "share" a post if we are friends or are connected to you online. While you might believe you are sharing your content only with close friends, remember that if you type it into an electronic device, you have made it accessible to others.

Your friends all have friends. I believe that you have ever locked your privacy settings. It doesn't always work. Online social media sites are constantly upgrading and updating their privacy settings, sometimes making it easier for your contacts or "friends of friends" to access your information and share with their networks. I'm sure that you have ever shared your friend's post to anyone else. When you think that your friend's post interesting, you forward it to another friend. Am I right?

LIVEWORKSHEETS

Your content has a longer shelf life. The days of images disappearing after a few seconds are gone. Screenshot images, sharing posts and the enhanced archiving features of many social media sites now make it possible to save your content for many generations to come. Someone with the right tools and some time on their hands can access those old posts you shared from middle school.

The last reason is that your posts are searchable. It means that your posts on social media can be tracked down pretty much. Social media platforms have enhanced their search features to promote trending topics and issues. This means that your content has become more searchable by greater number of people inside, and out of, your network, enhancing the opportunity for something you thought was long gone to resurface suddenly.

From those reasons, it is not wrong if we become cautious. To keep your privacy and prevent something bad happen in the future, we must be careful about the kind of content we post on social media.
