People celebrate many kinds of festivals, but the La Tomatina festival is definitely one of the most unusual. La Tomatina is a food fight festival where people throw tomatoes at each other for fun. It is held every year in the town of Buñol, Spain.

This festival, which is also known as "the world's biggest food fight", started in 1945. People tell different stories about how it began. Some people blame it on children causing trouble. Others say people were angry at the town's government. But most stories agree that there was an argument and then people fought with tomatoes. This tomato fight was so big that people remembered it and did it again the next year for fun.

La Tomatina always happens on the last Wednesday of August. The tomato fight usually begins at 11am, when a fleet of trucks transport more than 125,000 kilos of ripe tomato into the town, and **it** lasts for about 1 hour. All participants are advised to wear old clothes, while many others also wear goggles or masks to keep tomato juice out of their eyes.

The number of people joining La Tomatina used to be large but **manageable**. However, in recent years, the number of attendees has been limited to 20,000 because too many people were trying to visit the tiny town of Buñol, which led to safety and security concerns. This is why you need to book much in advance if you want to join the fun!

Read the following passage and mark the letter A, B, C, or D on your answer sheet to indicate the correct answer to each of the questions.

In the 1960s, doctors studying the survivors of the 1918 Spanish flu pandemic began to notice a trend: patients who were infants or young adults at the time of the pandemic appeared to have had been two or three times more likely to develop Parkinson's disease than others. Neurologists attempting to understand why this happens believe that this virus may be able to enter and, in some cases, damage the brain, starting a process of degeneration which can lead to Parkinson's.

Now, they are trying to monitor whether the current COVID pandemic will also trigger a higher rate of Parkinson's cases in the coming years. "We don't know but we need to consider that this could become the case," says Patrik Brundin, a Parkinson's researcher. "There are several studies highlighting that people who have recovered from COVID often have long-term central nervous system impairments, including loss of sense of smell and taste, brain fog, depression, and anxiety."

Over the past year, scientists like Brundin have been concerned by a small number of case studies describing patients who have developed abnormal symptoms similar to Parkinson's such as tremors, muscle stiffness, and impaired speech after COVID-19 infection. More recent research has found that some COVID patients have disruptions in one of the human body's most critical systems, known as the kynurenine pathway, which is used to produce a number of crucial amino acids required for brain health. When it malfunctions, there can be an accumulation of toxins which are thought to play a role in causing Parkinson's disease.

Many feel that there is a need for continued monitoring of any Parkinson's-like symptoms which emerge in people previously infected with COVID, in case the near future reveals a gradual spike in cases. However, Parkinson's is not the only concern. Experts around the world are trying to figure out if COVID-19 will induce a hidden wave of other illnesses related to the effects of the Sars-CoV-2 virus on our immune system. In the future, these research efforts can help us find new ways of detecting these diseases at an early stage, and even pave the way to new and more effective treatments and vaccines.
