

Cities in the Future

In the future, cities will change a lot. Many people will live in tall buildings. Homes will have smart technology, and robots will help with housework. Cars will be electric, and buses will drive themselves. People will not be driving cars because vehicles will be self-driving. There will be more parks and trees. People will be using flying taxis to travel quickly across the city. Robots will help clean the streets.

However, if we don't take care of the environment, there will be problems. The air will become more polluted, and some animals will disappear. We will be growing food on rooftops and in vertical farms to have more fresh food in the city. We will need to use less plastic and recycle more to keep our cities clean.

To stay healthy in the future, people should eat good food and exercise regularly. We should also use public transport or bikes to reduce pollution. People will be doing more outdoor activities in parks because cities will be greener. If we make these changes, life in future cities will be better for everyone.
