

Multiple Choice Questions

- What is the primary function of metabolism in living organisms?
A) To maintain homeostasis
B) To facilitate movement
C) To convert energy and nutrients
D) To reproduce
- Which of the following is a characteristic of living things?
A) Being non-responsive to stimuli
B) Being able to grow
C) Being inanimate
D) Being unable to reproduce
- What is the role of homeostasis in living organisms?
A) To increase body temperature
B) To decrease metabolic rate
C) To maintain a stable internal environment
D) To enhance reproduction
- Which of the following is not a characteristic of living things?
A) Growth
B) Reproduction
C) Response to stimuli
D) Being inanimate
- What is the process by which living organisms maintain their internal environment?
A) Metabolism
B) Homeostasis
C) Photosynthesis
D) Respiration
- Which of the following is a characteristic of living organisms?
A) Inability to grow
B) Inability to respond to stimuli
C) Ability to reproduce
D) Being non-living
- What is the primary function of the nervous system in living organisms?
A) To facilitate digestion
B) To respond to stimuli
C) To enhance reproduction
D) To increase metabolism
- Which of the following is a characteristic of living things?
A) Being unable to grow
B) Being unable to reproduce
C) Being able to respond to stimuli
D) Being inanimate
- What is the role of reproduction in living organisms?
A) To increase body size
B) To enhance metabolism
C) To produce offspring
D) To decrease population
- Which of the following is not a characteristic of living things?
A) Growth
B) Reproduction
C) Response to stimuli
D) Being non-responsive
- What is the process by which plants convert sunlight into energy?
A) Respiration
B) Metabolism
C) Photosynthesis
D) Homeostasis
- Which of the following is a characteristic of living organisms?
A) Inability to grow
B) Inability to reproduce
C) Ability to maintain homeostasis
D) Being non-living
- What is the primary function of the circulatory system in living organisms?
A) To facilitate digestion
B) To enhance reproduction
C) To transport nutrients and oxygen
D) To increase body temperature
- Which of the following is a characteristic of living things?
A) Being unable to grow
B) Being unable to reproduce
C) Being able to maintain homeostasis
D) Being inanimate

15. What is the role of growth in living organisms?
A) To decrease body size
B) To enhance reproduction
C) To increase body size or mass
D) To decrease metabolism
16. Which of the following is not a characteristic of living things?
A) Growth
B) Reproduction
C) Response to stimuli
D) Being non-living
17. What is the primary function of the excretory system in living organisms?
A) To facilitate digestion
B) To enhance reproduction
C) To remove waste products
D) To increase body temperature
18. Which of the following is a characteristic of living organisms?
A) Inability to grow
B) Inability to reproduce
C) Ability to respond to external stimuli
D) Being non-living
19. What is the role of adaptation in living organisms?
A) To decrease survival chances
B) To enhance competition
C) To increase survival chances in changing environments
D) To reduce genetic diversity
20. Which of the following is a characteristic of living things?
A) Being unable to grow
B) Being unable to reproduce
C) Being able to adapt to environments
D) Being inanimate

True/False Questions

1. **True or False:** All living organisms are capable of movement.
 - **Suggestion:** Not all living organisms can move; plants and fungi are examples.
2. **True or False:** Metabolism is essential for energy conversion in living organisms.
 - **Suggestion:** Metabolism involves processes that convert energy and nutrients.
3. **True or False:** Homeostasis is the ability of living organisms to change their internal environment.
 - **Suggestion:** Homeostasis involves maintaining a stable internal environment despite external changes.
4. **True or False:** All living things can reproduce sexually.
 - **Suggestion:** Some organisms reproduce asexually, such as bacteria and certain plants.
5. **True or False:** Response to stimuli is a characteristic of non-living things.
 - **Suggestion:** Only living organisms can respond to stimuli.
6. **True or False:** Growth is a characteristic that applies to all living organisms.
 - **Suggestion:** Growth involves an increase in size or mass over time.
7. **True or False:** Photosynthesis occurs in all living organisms.
 - **Suggestion:** Photosynthesis primarily occurs in plants, algae, and some bacteria.
8. **True or False:** Adaptation is a process that occurs over a single generation.

- **Suggestion:** Adaptation often occurs over multiple generations through natural selection.
9. **True or False:** All living organisms maintain homeostasis.
- **Suggestion:** Homeostasis is crucial for survival in changing environments.
10. **True or False:** Reproduction is essential for the survival of a species.
- **Suggestion:** Reproduction ensures the continuation of a species.
11. **True or False:** Metabolism involves only the breakdown of nutrients.
- **Suggestion:** Metabolism includes both the breakdown and synthesis of nutrients.
12. **True or False:** Living organisms can survive without water.
- **Suggestion:** Water is essential for the survival of all known living organisms.
13. **True or False:** All living things respond to stimuli in the same way.
- **Suggestion:** Different organisms respond to stimuli differently.
14. **True or False:** Growth in living organisms always results in an increase in size.
- **Suggestion:** Growth can also involve an increase in mass or complexity.
15. **True or False:** Evolution is a characteristic of living things.
- **Suggestion:** Evolution involves changes in populations over time, which is a characteristic of life.

Short Answer Questions

1. **Explain why reproduction is considered a fundamental characteristic of living organisms.**

Answer: Reproduction ensures the continuation of a species by producing offspring. It allows genetic information to be passed from one generation to the next, either sexually or asexually.

2. **Describe how living organisms maintain homeostasis.**

Answer: Living organisms maintain homeostasis by regulating internal conditions such as temperature, pH, and water balance, despite external environmental changes. For example, humans sweat to cool down or shiver to generate heat.

3. **How do living organisms obtain and use energy?**

Answer: Living organisms obtain energy through processes like photosynthesis (in plants) or consuming food (in animals). This energy is then used for growth, reproduction, and other cellular activities through metabolic processes.

4. **What is the role of adaptation in living organisms?**

Answer: Adaptation allows organisms to survive and thrive in changing environments by developing traits that improve their chances of survival and reproduction over generations.

5. **Why is cellular organization considered a defining characteristic of life?**

Answer: Cellular organization is essential because all living things are made up of one or more cells, which are the basic units of structure and function in organisms. Cells carry out essential life processes.

6. **Give an example of how an organism responds to stimuli in its environment.**

Answer: A plant grows toward light (phototropism), or a human pulls their hand away from a hot surface (response to pain).

7. What is the significance of growth and development in living organisms?

Answer: Growth refers to an increase in size or mass, while development involves changes in structure and function over time, enabling organisms to mature and reproduce.

8. How does energy processing differ between autotrophs and heterotrophs?

Answer: Autotrophs (e.g., plants) produce their own energy through photosynthesis, while heterotrophs (e.g., animals) consume other organisms to obtain energy.

9. What does it mean for an organism to regulate its internal environment?

Answer: Regulation involves maintaining stable internal conditions, such as body temperature or blood sugar levels, despite external changes.

10. Why is evolutionary adaptation considered a characteristic of life?

Answer: Evolutionary adaptation enables populations of organisms to change over time in response to environmental pressures, ensuring survival and reproduction.

Fill-in-the-Blank Questions

1. All living organisms are made up of one or more basic units called ____.
2. The ability of an organism to maintain stable internal conditions despite external changes is called ____.
3. Organisms that produce their own food using sunlight are called ___, while those that consume other organisms for energy are called heterotrophs.
4. The process by which living organisms pass on genetic material to their offspring is known as ____.
5. The characteristic of life that involves increasing in size or complexity over time is called ____.
6. The ability of an organism to respond to environmental changes is referred to as sensitivity or response to ____.
7. Organisms obtain energy from food through chemical reactions collectively known as ____.
8. The structural organization in multicellular organisms begins with cells forming tissues, which then form organs and ultimately form organ systems, demonstrating the characteristic of biological ____.
9. The process by which populations change over generations due to environmental pressures is called evolutionary ____.
10. Living organisms use energy for processes such as growth, reproduction, and maintaining homeostasis; this characteristic is known as energy ____.
11. Plants exhibit a response to light by growing toward it; this phenomenon is known as ____.
12. The ability of an organism to create new individuals either sexually or asexually ensures the survival of its species through the process of ____.
13. The maintenance of a stable body temperature in humans through sweating or shivering is an example of the characteristic called ____.

14. An organism's ability to grow larger and develop specialized structures over time demonstrates the characteristic of growth and ____.
15. In multicellular organisms, similar cells group together to form ___, which perform specific functions within the body.
