

Wildlife and Conservation

3rd Grade Reading Comprehension

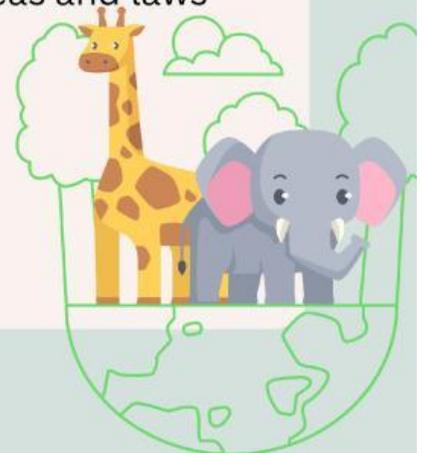

Wild animals live in different habitats around the world. Some live in forests, while others live in deserts, oceans, or mountains. These animals play important roles in their ecosystems. For example, herbivores like deer and elephants eat plants and help maintain the balance of plant life. They also help spread seeds through their movement.

On the other hand, carnivores such as lions and wolves hunt other animals. They control the population of herbivores, ensuring that ecosystems do not become overrun by one species.

Many animals, like birds and butterflies, are migratory. They travel long distances to find food or to breed. Migration is an important part of their survival.

Sadly, many wild animals are facing the threat of extinction.

Endangered species like tigers and pandas are at risk due to habitat destruction, poaching, and climate change. Conservation efforts are crucial to protect these animals and their habitats. People around the world are working together to create protected areas and laws to save these incredible species before it is too late.

All About Jellyfish

Comprehension Questions

- 1** What do herbivores eat?
- 2** Why do carnivores hunt other animals?
- 3** What is migration?
- 4** Why are many animals endangered?
- 5** What can be done to protect endangered species?

All About Jellyfish

True/ False Questions

- 1** Herbivores help control the population of carnivores.
- 2** Carnivores help maintain the balance of herbivore populations.
- 3** All animals that migrate do so to find food or to breed.
- 4** Endangered species are at risk mainly due to overpopulation.
- 5** Conservation efforts include creating protected areas for animals.
