

## Descriptive Text

**Bekantan** is a unique monkey that lives in Borneo, Indonesia. It is also called the proboscis monkey because of its long nose. The male has a much bigger nose than the female. Bekantan has reddish-brown fur and a long tail. This animal usually lives in mangrove forests and by the rivers. It is a good swimmer and can even swim across wide rivers. Bekantan eats young leaves, fruits, and seeds. This monkey is an endangered species, so it needs protection.
