

Camels have got thick, hairy ..... to protect their ..... from the sun in the hot desert. They've also got three ..... on each eye that open and close to protect them from the sand in a sandstorm. They have small ..... with hair inside to stop sand from getting in. They also have ..... in their ..... so that the sand can't get inside. They can open and close them easily, just like a polar bear. But camels need to do this to keep out the sand, not the water!

Camels have got a very big ..... with 34 strong ..... to eat leaves, grass and plants. Their ..... are thick and split in two, so they can eat thorny plants without hurting themselves. They've also got a long ..... to help them pull leaves from trees. A camel's ..... is attached to its body by its long ....., which helps it reach high branches.

On their backs, camels have a large ..... to store fat, which they use for energy when there is no food or water. Their ..... is thick to keep them cool in the day and warm at night.

Camels have got long, strong ..... to walk a long way across the desert. Their ..... have thick pads to protect them when they kneel on hot sand. Each foot has two ..... , and their wide, flat ..... stop them from sinking into the sand. Finally, they've got a long ..... with hair at the end to keep flies away.
