If you write a loop, you will repeat actions automatically.

If the syntax is wrong, the program won't run.

If your page is responsive, it will look good on any device.

If you click the button, the page will refresh.

If you create an array, you will store several values together.

If you design a good layout, users will easily find everything.

If you call a function, it will do a specific task.

If you forget the parameter, the function won't know what data to use
