

Pollution

Pollution is one of the biggest problems in the world today. It affects our environment our health and the future of our planet. There are many types of pollution, such as air pollution, water pollution, and noise pollution. Each of these courses serious harm to nature and to human life. Air pollution is caused by smoke from factories, vehicles, and the burning of waste. It makes the air dirty and harmful to breathe.

Breathing in polluted air can lead to health problems like asthma, lung infections and even heart disease. To reduce air pollution, people should use public transport, plant trees, and avoid burning trash. Water pollution occurs when factories dump dirty water into rivers or when people throw plastic and garbage into ponds and seas. It kills fish and makes the water unsafe for drinking.
