

| The Problem |
|---|
| 1. We have received thousands of calls for help in different languages. |
| 2. The roads are flooded and we don't know where people are stuck. |
| 3. We need to know which streets to close before the rain starts. |

| The AI Solution |
|---|
| A. Autonomous Drones: These can fly over flooded areas to spot people stranded on rooftops using cameras. |
| B. Predictive Analytics: Uses past weather data to calculate exactly which streets will flood first so we can close them. |
| C. Natural Language Processing (NLP): Instantly translates calls into Arabic for the police dispatchers. |
