

C. Read the passage below.

The Egyptians were famous for their mummification process. Since the process was expensive and time-consuming, it was only done for those who were wealthy. The mummification process began by removing the brain through the nose. A cut was then made on the left side of the body. The internal organs were removed and left to dry. Later, the lungs, intestines, stomach and liver were placed inside canopic jars which were carved from limestone or made from pottery. However, the heart was placed inside the body and the body was rinsed with wine and spices. For the next 70 days, the body was covered with natron, a salt mixture from the

lake. After 40 days, the body was covered with sand to give it a human shape and after 70 days, the body was covered from head to toe with a bandage. Finally, it was placed in a coffin, carved out of stone.

Rearrange the steps for the mummification process.

Remove the internal organs and dry them.	
Cover the body with natron for 70 days.	
Finally, place the mummy in a stone coffin.	10
Rinse the body with wine and spice.	
Place the lungs, intestines, stomach and liver in canopic jar.	
Make a cut on the left side of the body.	
Cover the body with sand after 40 days.	
Cover from head to toe with a bandage.	
Remove the brain through the nose.	1
Place the heart inside the body.
