Nobody knows how many planets there are in our galaxy and whether there is life on other planets. And the Kelper has the mission to find the answer to those questions.

In 2009, NASA launched the Kelper space telescope to **find** planets that support life. It has discovered five new Earth-sized planets beyond our solar system so far. These planets are hotter than the Earth. The Kelper team predicted that it will take them at least three years to find an Earth-like planet. This mission costs about six hundred million dollars.

The simplest requirement for a planet to have life is water (not frozen or gas), so the distance from the planet's sun and therefore temperature is important. The planet also needs a certain amount of air. If a planet is as small as Mars (half the size of Earth), it can't hold on to air molecules because of weak gravity. If a planet is four times bigger than Earth - Neptune size - it has very **strong** gravity and too much air. Therefore, the size of those planets also matter.

Question 31: What is the mission of the Kelpler?

- A. To answer the questions about the Earth.
- B. To build an Earth-like planet.
- C. To find life on other planets.
- D. To train NASA astronauts.

Question 32: How many Earth-sized planets has Kepler discovered so far?
