

IDENTIFYING VERTEBRATES

NAME _____

DATE _____

A house cat is obviously a cat. But how would you classify the animal below? It's a South American mammal called a coati (*Procyon*). It is classified in the same family as raccoons.

Use the information on pages 205–12 of your textbook to identify the groups of vertebrates described below.

1. vertebrates that have feathers and lack teeth

2. vertebrates that have fur or hair

3. smooth-skinned vertebrates that typically live in water when young but can live on land as adults

4. vertebrates that have scales and lungs

5. vertebrates that have gills and bony skeletons and are usually covered by scales

6. ectothermic aquatic vertebrates that have gills and fins

7. aquatic vertebrates that have gills but lack scales and paired fins

8. aquatic vertebrates that have jaws, scales, and endoskeletons made of cartilage

9. animals that live in water as young and on land as tailless adults

10. tailed vertebrates that have moist, scaleless skin

11. scaly ectothermic vertebrates that molt their skin

12. vertebrates that have scutes and teeth

13. vertebrates that have two hard, bony shells

14. endothermic vertebrates that are connected to their developing young by umbilical cords

15. furred vertebrates that lay eggs

16. endothermic vertebrates that have pouches

IDENTIFYING INVERTEBRATES

NAME _____

DATE _____

You can probably tell that the animal below is a spider. Your recognition of that fact was an act of classification. You used characteristics like the animal's size, shape, and jointed legs to place it into a group of organisms called spiders.

© 2019 Pearson Education, Inc. All rights reserved.

This daring jumping spider captures its prey by hunting rather than by using a web like most spiders do. It poses no threat to humans; in fact, it is less than an inch long.

In the activity below, use the same process to identify the group being described in each question. Use the information on pages 244–244 of your textbook.

Write the common name for the group of animals described.

- | | |
|--|---|
| 1. marine animals that have stinging cells to paralyze and capture prey
_____ | 8. animals that have complete guts but are otherwise very simple
_____ |
| 2. animals that have soft bodies and are divided into repeating body segments
_____ | 9. arthropods that have six legs and three body segments
_____ |
| 3. animals that have spiny skins and live in the ocean
_____ | 10. mollusks that have multiple tentacles
_____ |
| 4. animals that have an exoskeleton and jointed appendages
_____ | 11. arthropods that have eight or ten legs
_____ |
| 5. animals that have soft and flattened bodies
_____ | 12. mollusks that have two-piece, hinged shells
_____ |
| 6. animals that have soft bodies and, frequently, shells
_____ | 13. arthropods that have eight legs and two body segments
_____ |
| 7. animals that lack symmetry and cephalization
_____ | |
