Hi everybody! My name is Sofia Morales, and I'm an economist. Today, I would like to begin my presentation with a question: *What would happen to society if everyone had access to decent work and fair economic opportunities?* This question made me reflect on how important employment and economic growth are for improving people's lives and creating stronger communities. For that reason, I want to share with you why decent work and sustainable economic growth are essential for the future of individuals and societies. Today, I will discuss three important aspects related to decent work and economic growth: the importance of employment and fair wages, the role of skills and training in improving productivity, and the impact of innovation and business development on economic progress. First, when it comes to employment and wages, we should ask ourselves: "Why is decent work important for people's lives?" Having stable employment allows individuals to support themselves and their families, improve their income, and achieve a better quality of life. However, not all jobs provide fair wages or safe working conditions. Many workers around the world still face difficult labor conditions and low salaries that do not cover their basic needs. If we truly want stronger economies, we need to create more opportunities for decent work where people are respected, protected, and paid fairly for their labor. Regarding the importance of skills and training in today's world. As technology and industry continue to change, workers need new abilities to stay competitive in the job market. Training programs can help people develop professional skills and improve their productivity. For example, learning digital or technical skills can open the door to better employment opportunities and higher wages. Education and continuous learning are essential for helping workers adapt to modern industries and economic changes. By investing in people's development, countries can build a stronger and more prepared workforce. Finally, in terms of the role of business and innovation in economic growth, businesses create jobs, generate income, and contribute to the development of society. At the same time, innovation helps industries become more efficient and productive. New technologies and creative ideas can improve products, services, and working conditions. Small businesses and entrepreneurs also play a major role in economic development because they often create local employment opportunities and support communities. If governments and companies encourage innovation and support businesses, economies can grow in a more sustainable and inclusive way. To sum up, today we explored the importance of decent work and economic growth by reflecting on three key ideas: the value of fair employment and wages, the importance of skills and training for improving productivity, and the impact of business and innovation on economic development. By examining these aspects, we can understand that economic growth is not only about making money, but also about creating opportunities, improving living conditions, and supporting human development. My purpose in sharing this with you was to encourage awareness about the importance of building economies that provide fair opportunities for everyone. It is only through decent labor conditions, quality education, and support for innovation that societies can achieve long-term progress. But here is something important to think about: imagine how different the world could be if every person had the chance to work in safe conditions, earn fair wages, and develop their full potential. Real economic growth happens when people are given the opportunity to succeed. Thank you all for your time and attention.

- The speaker begins the presentation by describing the history of international trade agreements.
- The presentation suggests that fair wages are not necessary for improving workers' quality of life.
- The speaker explains that training programs can help workers improve their skills and productivity.
- According to the presentation, technology has reduced the importance of education and professional development.
- The speaker argues that small businesses do not contribute significantly to local communities or employment.
- Innovation can help industries become more efficient and improve working conditions.
- The presentation states that economic growth is only about increasing profits for large companies.
- The speaker believes that workers no longer need to adapt to changes in modern industries.
- The conclusion claims that governments should avoid supporting businesses and entrepreneurs.
- The speaker says that decent labor conditions have little impact on long-term economic progress.
