

READING: CARING FOR THE ELDERLY

The world's population is getting older. In many countries, people are living longer because of advances in medicine, better nutrition, and improved healthcare services. As a result, doctors and healthcare professionals need to understand the challenges related to caring for elderly patients.

Older adults often have different medical needs. Some elderly patients suffer from chronic diseases such as diabetes, hypertension, arthritis, or heart problems. Others may experience memory problems or reduced mobility. Healthcare professionals play an important role in helping them maintain a good quality of life.

In the future, there will probably be more elderly people and fewer young people. Healthcare systems will need to adapt. Doctors will provide medical treatment, emotional support, and guidance for patients and families.

Many elderly people hope to remain independent. However, some may need assistance with daily activities such as eating, taking medication, or moving safely.

Technology will also change elderly care. Doctors will use digital tools to monitor patients' health. Telemedicine will help elderly people receive medical advice without always visiting a hospital.

Caring for older adults requires patience, empathy, and communication skills. Elderly patients are individuals with personal histories, emotions, and needs. Future healthcare workers specialized in elderly care will help older adults live healthier and safer lives.

1. TRUE / FALSE

1. The number of elderly people is increasing in many countries. ____
2. Medical advances help people live longer. ____
3. Elderly patients usually have fewer healthcare needs. ____
4. Doctors will only provide medical treatment in the future. ____
