

A doctor is a person who helps sick and injured people. Doctors work in hospitals, clinics, and health centres. They check patients, find out what is wrong, and give medicine. They also teach people to eat healthy food, exercise, and stay clean. Doctors use tools such as a stethoscope, thermometer, blood pressure monitor, and torch to examine patients. There are different types of doctors. A paediatrician treats children, a dentist cares for teeth, and an eye doctor treats eye problems. Doctors work hard every day to help people stay healthy.
