

ENVIRONMENTAL PROBLEMS IN OUR CITIES

READ

Paragraph 1:

In many cities around the world, there are serious environmental problems. Air pollution comes from cars, buses, and factories. The smoke from vehicles contains harmful chemicals that damage our lungs and the atmosphere. Many people wear masks to protect themselves, but the best solution is to reduce the number of cars on the streets and use cleaner energy.

Paragraph 2:

Water pollution is another major problem. Many rivers and lakes are contaminated with plastic bottles, bags, and chemical waste from factories. This pollution kills fish and other animals, and it also makes the water unsafe for people to drink or use. Communities need to stop throwing trash in the water and start recycling more plastic and glass.

Paragraph 3:

Waste on the streets is also a big issue in many neighborhoods. People throw plastic bags, bottles, and food wrappers on the ground instead of using trash cans. This makes the city look dirty and attracts insects and rats. The solution is to put more recycling bins in public places and educate people about the importance of keeping their streets clean.
