

GROUP TASK: WHAT TYPE OF ROCK IS THIS?

This rock used to be limestone, but it changed after lots of heat and pressure deep underground. It looks shiny and smooth, and sometimes has swirls or sparkly crystals. It is very strong and is used in statues and buildings.

This rock is dark and smooth. It formed after hot lava cooled down quickly on the Earth's surface. If you look closely, you might see tiny crystals or holes where bubbles popped. It is very hard and often found near volcanoes.

This rock is made from tiny sea creatures and shells that were pressed together over a long time. It can feel smooth or a bit chalky, and sometimes you might find fossils inside it! This rock was formed in warm seas. In the UAE, it is found in the mountains and deserts.
