

UNIT 4. PLANTS

PHOTOSYNTHESIS

1. Match the things plants need to make photosynthesis to where they get them.

- | | | | |
|----------------------|---|---|---------------|
| a light energy | ● | ● | from the soil |
| b water and minerals | ● | ● | from the sun |
| c carbon dioxide | ● | ● | from the air |

2. Order the stages of the process of photosynthesis.

The plant takes in light energy and carbon dioxide through the leaves.

They are transported through the stem to the leaves.

The light energy helps the water, nutrients and carbon dioxide react and make food.

Water and nutrients are absorbed from the soil by the roots.

Oxygen is also produced and released into the air.

The food is transported to all parts of the plant.
