

TRANSNATIONAL TEAMS FOR THE FINAL PRODUCT

GLOBAL WARMING

(Seventh Team: İbrahim SARIKAYA – Murat ÖZTÜRK)

Global warming is the rise of the average temperature on earth. If the temperature increases the glaciers will continue to melt. Greenhouse gases keep the earth warm. However, the more greenhouse gases get into atmosphere, the warmer our earth will get and it is not good. Greenhouse gases such as carbon dioxide and volcanic eruptions have impact on global warming. When volcanoes erupt they can change the temperature of the earth. Sea levels will rise and flood the coastal areas. Animals will have to migrate to cooler places as their old habitats gets warmer. We should reduce water waste, so we should take shorter showers, turn off the tap while brushing our teeth.. We should use public transportation or electrical cars. We shouldn't leave electrical devices plugged when we don't use them.

1- Greenhouse gases are one of the reason of global warming.

.....

2- Volcanoes never change the temperature.

.....

3- We should use our resources wisely and save energy.

.....
